

How the ticketing system works

A simple guide for staff, admins, IT support and the JMS team. Every problem becomes a ticket, and every ticket follows the same path from "reported" to "fixed and rated".

The big picture in 5 steps

Who is who

Role	Belongs to	What they do
Staff (user)	A partner company	Reports problems, follows progress, replies, confirms the fix and rates it. Can cancel a ticket until it is accepted.
Admin	A partner company, or JMS	Accepts new tickets and assigns an engineer. A company admin is created by the super admin.
IT support	A partner company, or JMS	The engineer. Sees only the tickets assigned to them, updates the status and writes the resolution.
Super admin	JMS One IT	Full access. Accepts and assigns JMS engineers to any company, and manages companies, users and reports.

Good to know: a ticket always belongs to the company of the person who logged it. Each company only ever sees its own tickets.

The life of a ticket

Every ticket has one status at a time. This is the journey it can take.

What each status means

Status	Meaning	Who moves it
Open	Submitted and waiting for an admin to accept it.	Created by staff
Assigned	Accepted and handed to an IT engineer.	Admin / Super admin
In progress	The engineer is working on it.	Engineer
On hold	Paused, for example waiting for a part or for the user.	Engineer / Admin
Resolved	Fixed. The engineer wrote what was done (at least 10 characters).	Engineer / Admin
Closed	The requester confirmed the fix and gave a 1-5 rating.	Requester
Cancelled	Withdrawn by the requester. Only possible while Open and unassigned.	Requester

A real example

1	Jenny (staff at Northwind Trading) cannot open her email. She logs a ticket: "Outlook keeps asking for my password", category Email / Account Access.
2	The ticket is Open . Northwind's admin sees it, accepts it and assigns Ana (their IT support) as a remote support job.
3	Ana starts work (In progress), then writes: "Reset the mailbox password and re-synced Outlook." The ticket is Resolved .
4	Jenny checks her email, confirms it works and rates it 5 stars. The ticket is Closed .
5	If Ana could not fix it, she presses Need JMS support . A JMS admin then assigns a JMS engineer (Path B on the next page).

Two ways a ticket gets fixed

Most tickets stay inside the company. If the company cannot solve it, JMS steps in.

Who can assign whom

Who assigns	Can assign to	Why
Company admin	Their own company's IT support	The company owns its own tickets.
JMS admin	JMS support engineers	JMS dispatches its own team.
Super admin	JMS support engineers	Same as JMS admin, for any company.
IT support (any)	Nobody	Engineers work tickets; they do not assign them.

Service targets and house rules

Every ticket gets a fix-by time based on its priority. The clock is shown on each ticket.

Critical fix within 4 hours	High fix within 8 hours	Medium fix within 24 hours	Low fix within 72 hours
---------------------------------------	-----------------------------------	--------------------------------------	-----------------------------------

Handy rules

Topic	How it works
Visibility	Staff see only their own tickets. Engineers see only tickets assigned to them. Admins see their company. JMS sees all.
JMS lock	Once a JMS engineer has a ticket, only JMS can reassign it. The company can still reply on it.
Replies and notes	Staff and engineers chat on the ticket. Internal notes are hidden from the requester.
Attachments	Screenshots, error photos and log files can be added to tickets and replies.
Remote or on-site	When assigning, the admin chooses remote support or an on-site visit. On-site visits appear on the Schedule calendar.
Reopening	If the fix did not work, the requester can reopen a resolved ticket and it goes back to the engineer.
Notifications	People are notified when a ticket is assigned, updated or replied to. Admins also get a live "waiting for acceptance" list.
Ticket numbers	Every ticket gets a unique number such as JMS-261010-AB12 (date plus a short code).
